SQCD-1 in brief

The record a delivered compute hour settles on.

Conformance is to SQCD-1 · Settlement Quality Compute Data alone, and where the two disagree the standard governs.

Issued by PSYCHE · Version 1.1 · 2026-11-10

Two parties dispute a month. Each holds logs, each set is internally consistent, and neither can compel the other to accept its numbers. Six weeks later a figure is agreed on a call, and nobody writes down how it was reached.

Every clause reference below points into the standard. SQCD-1 governs the form of the record that settles delivery. Availability targets, prices, remedies and credit schedules stay in the agreement. The standard's §2 sets out why a record filed by interested parties can carry weight.

A · Contract Standard

A1 Obligation reference — the clause the record answers to. **A2** Metric definition — the quantity, its unit, and the function that turns samples into a period figure, named from Annex 2 or stated in full in the Filing Plan where Annex 2 does not contain it. **A3** Measurement window — start, end, offset, and the treatment of samples straddling either edge. **A4** Exclusions — each with the evidence required to invoke it. **A5** Tolerance and threshold. **A6** Materiality and the unresolved ceiling — two numbers, both fixed before the window, and, for every materiality form but MT-05, the Filing Party whose figure materiality is read against. **A7** Remedy schedule reference — held where the evaluation cannot read it. **A8** Grade Class — the kind of compute hour, over nine dimensions: accelerator, intra-node interconnect, inter-node fabric, host, attached storage, external network, locality, tenancy, software floor. Every field valued or marked `not-material`. **A8.10** Verifiability tier, per field. **V1** the customer establishes by measurement, without the provider's cooperation and without a vendor key · **V2** a hardware root of trust signs it and the customer verifies against a manufacturer's chain · **V3** the customer reads it through an interface the provider operates · **V4** established by a signed statement. **Field assignments are in A8.10 of the standard**, and A8.11 states what `tenancy` does and does not cover. **A8.11** Every V4 field carries a required evidence class, signed before the window under the A10 digest. **A9** Substitution and netting — what may be set against what. **A10** Standard digest — one commitment over A1 through A9, carried in an event that precedes the window.

B · Measurements

B1 Channel. **B2** Samples at the recorded interval. **B3** Measured subject, at the grain the contract names. **B4** Measuring party and instrument. **B5** Clock source and stated accuracy. **B6** Aggregation applied before filing.

B7 Layer — the stratum at which the series observes.

	Layer		Layer
L1	Facility	L5	Storage
L2	Host	L6	Network
L3	Accelerator	L7	Control plane
L4	Interconnect	L8	Tenant workload

The obligation names its covered layers. Whether an interval counts as delivered turns on **every covered layer at once**, and on L8 never counting against the provider (B7.2, B7.3).

B8 Minimum customer-side observation — what a customer observes on an interval, and at what cadence (B8.2–B8.5).

C · Missing Intervals

C1 Interval. **C2** Cause, from a controlled vocabulary. **C3** Attribution. **C4** Scope, materiality and signature over C1–C4. **C5** Value assigned.

Two fractions are stated on the face of the record, each a share of the Window's intervals less A4 exclusions: the **Unresolved Fraction**, intervals no party observed, and the **Unilateral Fraction**, intervals exactly one party observed (C5.1, C5.2).

D · Provenance

D1 Filing party and signing key. **D2** Source class. **D3** Independence — whether two required sources share a trust root. **D4** Signature over the filed set, algorithm named.

E · Temporal Binding

E1 Signing time as claimed. **E2** Inclusion proof against a published log head.

F · Claim and Decision

F1 Delivery claim — window, standard, subject, the pass it rests on, and the value at risk; the quantity is the one carried forward for that pass under H3 or Annex 2.7, recomputed from the filed samples, or, while Annex 2.7 has not yet decided it, the pass's candidate figures with their bases; the evidence set is the evidence receipts that name the claim. It carries no verdict. **F2** Counterparty decision — accept, reject, dispute, or abstain. **This field alone produces `accepted`; reject and dispute are terminal decisions; where no terminal decision has taken effect by the review deadline, as after an abstention alone or accepts below quorum, the closing of the review window or the timeout at the Case deadline produces `expired` under I.1.1. F3** Authority reference — the grant F2 was signed under, and its limits.

The clock

Business days after the window closes	Event
W+2	Both parties file measurements
W+5	Divergence computed; any divergence event filed
W+7	Delivery claim filed
W+12	Counterparty decision due
W+30	Correction window closes
W+45	**Quantity finality**
W+90	**Money finality**

Section I governs, including I.1.4, under which a Profile may state further recomputation passes.

The seven the parties fix, and this standard refuses to

	Term	Clause
1	Materiality threshold	A6
2	Unresolved ceiling	A6
3	Required evidence class for every V4 field	A8.11
4	What expiry costs the silent party	I.1.1
5	Evidence-fault allocation, per obligation	J1
6	Divergence resolution	H4
7	Conformity decision near a limit	7.0.2.1

Each is fixed before the window opens, and all except the third are selected from a published set in Annex 2. Annex 8 lists all thirty-six terms an agreement must fix.

Completeness

§4.6 states the test: give the record to someone who was absent and holds no account on either side, and see whether the figure, the shortfall and the amount owed all come out, and each traces to a named field.

The standard is **SQCD-1 · Settlement Quality Compute Data**, in this repository, with conformance vectors under `sqcd1-vectors/`, the canonical period functions under `sqcd1-registry/`, and the formal model in *Signed in Advance*.

Send a closed case and PSYCHE will reconstruct it under SQCD-1.
